

Trip plans that **actually** fit.

Ausflieger is an agentic trip planner focused on schedule coordination. An agent researches activities, restaurants, events and holidays and delivers them as swipeable cards with sourced facts. You drag the cards into a mobile day calendar.

The conflict manager. Every slot is checked against opening hours, last entry, fixed bookings, walking-time ranges and holidays. Ausflieger explains why something does not fit ("**Visit ends at 18:40, after Residenz München closes at 18:00**") and marks uncertain facts as **needs checking** instead of guessing.

How it is built

Agent 37	Runs the research agent (OpenClaw template); subagents research cards in parallel. The agent also deployed the web app.
Context.dev	Primary scraper: official venue, hotel and event pages into structured JSON (hours, last entry, breakfast, closures).
Monid	Tool discovery: the agent picks the best tool per task (places, events, holidays, routing, PDF parsing).
Supabase	Trips, cards and fact-level evidence; Realtime streams new cards into the app; Storage for booking PDFs.
InstaCloud	Hosts the web app.
Planner	Deterministic, client-side schedule checks: the agent supplies facts, the planner decides feasibility.

Demo: Munich during Oktoberfest, 2–3 Oct 2027

108 researched facts from official sites and muenchen.de. 3 Oct is German Unity Day: a holiday triggers a check of each venue's special hours and never implies closure.
