

Ausflieger

Trip plans that actually fit.

Ausflieger is an agentic trip planner focused on schedule coordination. An agent researches activities, restaurants, events and holidays, delivers them as swipeable cards with sourced facts, and a conflict manager checks every slot of your day.

WHAT IT DOES

Swipe, drag, and know why something doesn't fit

Ausflieger — trip plans that actually fit

1 • Swipe suggestions
researched cards with sourced facts

2 • Drag into your day
every slot checked, conflicts explained

3 • Evidence per fact
uncertain facts marked "needs checking"

The conflict manager. Every slot is checked against opening hours, last entry, fixed bookings, walking-time ranges and public holidays. Ausflieger explains why something does not fit — **"Visit ends at 18:40, after Residenz München closes at 18:00"** — and marks uncertain facts as **needs checking** instead of guessing.

1 • Preferences

Destination, dates, arrival and departure, a booking PDF, meal times, interests, visit style (short / normal / long) and pace.

2 • Suggestions

The agent researches sights, museums, restaurants, events and holidays. Cards stream in live; swipe right to keep, left to skip. "Search again" adds alternatives without touching your plan.

3 • Schedule

One day at a time. Drag cards from the drawer into the day; times, walking ranges and buffers recalculate instantly in the browser. Fixed bookings are locked; research updates arrive as proposals you accept, never as silent moves.

Evidence per fact

Operator-confirmed, regular hours, estimated, unknown or conflicting — each with source URL, retrieval date and the dates it applies to.

Agents research. The planner checks.

Sponsors and tools

Agent 37	Runs the research agent (OpenClaw template). OpenClaw subagents research several cards in parallel. The agent also deployed the web app to InstaCloud itself.
Context.dev	Primary scraper: official venue, hotel and event pages into structured JSON — opening hours, last entry, breakfast times, special closures.
Monid	Tool discovery: for each task the agent picks the best tool (places, events, holidays, routing, PDF parsing).
Supabase	Trips, cards, places and fact-level evidence in Postgres; Realtime streams new cards into the app; Storage holds booking PDFs; row-level security keeps the demo read-only (each visitor gets a clone).
InstaCloud	Hosts the web app (Node server + Vite/React build).
Planner	Deterministic TypeScript engine in the browser (62 tests). The agent supplies facts; the planner decides feasibility.

Munich during Oktoberfest, 2–3 Oct 2027

Saturday 2 Oct

- ICE arrival 09:16 · luggage at Hotel Uhland
- Glockenspiel at Marienplatz 11:00 (fixed)
- Frauenkirche tower · lunch at Weisses Bräuhaus
- Viktualienmarkt · Residenz München (last entry 17:00)
- Hotel check-in · dinner at Augustiner-Keller

Sunday 3 Oct · German Unity Day

- Hotel breakfast · check-out
- Wiesn from 09:00 · Böllerschießen at the Bavaria 12:00
- Alte Pinakothek · ICE departure 18:32

Showcase conflicts

- Residenz after check-in → closes at 18:00
- Frauenkirche before 11:00 → Glockenspiel unreachable
- Viktualienmarkt on 3 Oct → documented holiday closure
- Deutsches Museum on 3 Oct → holiday hours not confirmed (needs checking)
- Schumann's on Saturday → sources disagree

Research rules

- Planning-critical facts first: fixed times, date-specific hours, closures, last entry
- Authoritative, date-specific sources; a second independent source for critical facts
- Holidays at national, regional and city level trigger a check — they never imply closure
- Disagreements are kept and flagged; missing values are never invented
